

FinOps

Use Case

Zones Innovation Center is a multidisciplinary and collaborative technology environment that helps transform business use cases into working prototypes. Leveraging technology expertise, OEM alliances, and scalable technology platforms, Zones assists businesses in simplifying and accelerating their digital journeys. This use case showcases 'FinOps' capabilities.

Solution Overview

FinOps addresses the visibility of costs in the multi-cloud environment and has been recognized as a discipline of its own. This shows the importance of cost governance throughout the industry and hence is part of the service delivery platform that we have put together. In today's demo, let us look at how organizations can use FinOps practice to manage cloud costs efficiently. We would be looking at CoreStack which is our partner's offering that specializes in AI powered continuous and automated cloud governance. Along with FinOps

it also helps achieve end-to-end governance needed in SecOps and CloudOps.

Corestack gives enterprises the confidence to go further, faster, so you can more quickly capitalize on the opportunities that matter. These powerful capabilities enable you to optimize cloud spending while ensuring security and compliance across multi-cloud. It helps implement cloud governance best practices by applying a Well-Architected Framework and leverage AI to achieve integrated and continuous governance across FinOps, SecOps, and CloudOps.

Manage reporting, recommendations, and remediation across multiple cloud platforms in a unified dashboard.

Lab Video Overview

In this lab video we have onboarded one of our cloud subscriptions into the Corestack. The architecture would remain same for any cloud where data will mostly be fetched over API through the subscription, analysed and represented through dashboards and reports. The video is focused on showcasing capabilities of platform and is primarily focused on the FinOps operations
